How Rehabilitation Uses Learning

Across

1. A routine that barely needs a reminder anymore.

5. Like toothbrushing, no step-by-step committee required.

8. Yesterday's tricky steps, today's well-worn path.

9. Something that can grow smoother with experience.

11. A grocery aid that remembers the milk for you.

12. What a speech therapist may help become more reliable.

15. Ask memory's librarian for a previously saved fact.

16. Change the method while keeping the goal.

17. A familiar action after a recognizable warning.

18. Experience-driven changes in how nervous-system networks work.

22. The body's inside-news service for hunger and heartbeat.

24. Use words aloud instead of typing them.

Down

2. That three-pound student keeps learning after graduation.

3. Paper backup when memory takes a coffee break.

4. The real-world purpose behind a therapy activity.

6. Knowing where your elbow is with your eyes shut.

7. The therapist's tiny prompt, not a pool stick.

10. Raise the cup; its weight may surprise your hand.

13. Keeping a skill after the practice session is over.

14. What a nervous system can do without enrolling in school.

19. A body message, such as hunger or a heartbeat.

20. Where attention goes when one task takes priority.

21. The sense recruited by a bright visual target.

23. Speech's tiny pit stop when thoughts get tangled.
